

DJ Mixing Station Studio

Offline-first recommender that turns a small set of user anchors into playable playlists while keeping key controls transparent: vibe, platform bias, discovery style, and duration.

Offline version rolled out

Go-live version in development

Current offline UI: transparent controls + playable outputs

What shipped and how it works

Shipped product

Built an offline-first recommender in Python + Streamlit with Quick Mode, Self Mix, and cross-platform playlist actions.

Transparent controls

Visible levers for vibe, platform bias, discovery style, and duration, plus diagnostics for recommendation shifts.

Go-live roadmap

- Move from local runtime to managed storage, CI/CD, monitoring, and rollback controls.
- Instrument core events and support experimentation for future ranking and UX changes.
- Develop toward public deployment without end-user local setup or Kaggle credentials.

Success metrics and why it matters

Time to first playlist

Faster first playable result

Output quality

Playlist fit + control fidelity

Repeat usage

Value and trust signal

Shows recommendation-system thinking, transparent controls, user-facing metrics, and explainability.
